Proposed: Recipe Manager

Program from which the user can create, read and delete recipes.

Let's create this structure in the team:

The program will do the following:

- Will welcome you

- It will inform you of the location of the recipes
- It will inform you of the number of recipes in the folder
- It will offer a menu showing the following options:
 1. Read recipe
 - 1. It will ask us the category
 - . It will display the recipes in that category.
 - . Once this is said, it will show us the recipes and ask us which recipe we want to read.
 - . It will show us the content of said recipe.
 - . Create recipe
 - 1. It will ask us for the category.
 - . Then it will ask us for a name and content and will create the archive.
 - . Create category 1.
 - It will ask for the name
 - . It will generate the folder with the name
 - . Delete recipe
 - 1. Same as 1 but removes the recipe
 - . Delete category
 - 1. Ask for the category to delete
 - . End program
- Every time the user performs a correct action, we will ask the user to press a key and return to the initial menu.
- Every time we return to the initial menu, we will clear the console.
- Develop your code using functions
- Analyze your program before you start coding
